Advanced Operating Systems (COEN 383)

Project-1 (4 pts)  
Instructor: Ahmed Ezzat

## **UNIX up and running**

The purpose of this quick assignment is to make sure everyone has the same access to Linux development environment within the same group; this is an individual assignment.

The objective is for each student to successfully compile and run the C program ([forktest.c](#)) on a Linux system and to [provide a screenshot of the compilation and execution](#).

If you already have access to Linux system (such as remote server), then you are all set to create a screenshot. Otherwise, you may need to install Linux on your laptop or personal computer.

## **Windows**

Students using Windows can install the [VirtualBox](#) virtual machine Manager (VMM) and install the [Debian Linux](#) OS in a virtual machine. You can also use another VMM such as [VMWare](#). Another flavor of Linux or UNIX is OK, too, but then you may encounter differences in the APIs or in the system utilities.

## **Mac**

Students using Mac can also install [VirtualBox](#) and [Debian](#) like the Window users. An option is to use the built-in BSD UNIX that is the foundation for OS X. You shall need to install the Xcode developer tools, and you may encounter differences from Linux in the APIs or in the system utilities.

Email a message to the grader that you posted your project to Camino. Your subject line should be **COEN383 Assignment #1, Group-n**.
